Diabas "dolerite hyperite" is a very exclusive and inaccessible volcanic rock. It was formed under enormous outbreak from the earth for about 900-1500 one million years ago. Red-heat magma is pushed up when the long, narrow aisles, usually only up to 50 m wide and 900 m long, and then over millions of years to solidify and get to this black and captivating stone. Then, when the ice pulled out and scratched the top layer of the crust, Diabas came to light, and only in a few places in the world. The dolerite that is found in northeastern Skane regarded as the undisputed number one and here has the break of stone for over 100 years marked many people's life stories and create dramatic openings in the landscape.
